STATION KNAZ-TV(NBC) Channel Two  
LOCATION Flagstaff, Arizona  
PROGRAM News 2Nite

Corrie Houston, co-anchor:

Are you working in a sick building? One that could pose a potential threat to your health? Well, chemist Grey Robertson claims as many as half of the office buildings, hospitals and government buildings are suffering from the problem of contaminated ventilation systems. He says, in an effort to save money, a minimal amount of fresh air is allowed into the system, so vents become dust binds and can become breeding grounds for fungus and disease. Well, Robertson also warns the home is also susceptible.

Grey Robertson (Chemist): No home--I say no home--hardly any home built in this country has any fresh air intake. Once you go in and shut the doors and windows, you're living on one hundred percent recycled dust. So all the situations I've described logically can also apply in that home.

Houston: Some ways to help cure the problem: Allow more fresh air in; use higher grade filters and have the ducts cleaned on a regular basis.
